

Christmas Tree Care Guide

Follow these steps to keep your tree fresh all season!

- 1** **Cut about 3/4 inch off of the bottom** the tree stump, to expose fresh wood.
- 2** **Use hot tap water for your first watering.** This will help sap to flow easily as the tree thaws, sending moisture to branches & needles. Place the tree in water while the cut is still fresh (within a few hours), so the bottom doesn't begin to seal against water intake.
- 3** **Keep your tree well watered!** Don't let your tree stand's water reservoir dry out. Most trees consume about 1 litre of water per day per inch of stem diameter.

PRO TIP: Tuck a tree bag under your tree stand to simplify cleanup later!
